

File – Folders

Menu: **File > Folders**

Changes where RC stores its data — profiles, jobs, fields, rate maps, and logs. Useful for moving the data to a synced folder (OneDrive, Dropbox, etc.) or to another drive.

Control	Description
Current location	The data folder currently in use
New location	Press to browse for the new data folder; the chosen path can also be typed in the box
Copy Data	Copy the contents of the current data folder to the new location. Leave unchecked to simply switch to a folder that already contains RC data.
Overwrite	Allow copying into a folder that already contains files. Without this, Copy Data only copies into an empty folder.

Usage

1. Press **New location** and select the destination folder.
2. Check **Copy Data** to move your existing data along, or leave it unchecked to use data already in the destination.
3. Press **OK** and confirm. RC changes the folder and restarts.

Note: The new location cannot be a sub-folder of the current data folder. When copying, the destination must be empty unless **Overwrite** is checked.
